

Basmala Abdelkader- Journal

We started out by simply meeting up, and planning out how the project will work. Each of us brainstormed, and came up with ideas, so we then shared the github repo, and started our individual work.

I think it was alright in terms of the operations that we are used to, but what was more difficult to deal with was the operations that dealt with numbers on a binary/ bit level. Things like the u format instructions (and that was one of my tasks) which dealt with the upper 20 bits. And so on!

We also created 6 test cases, and those were done by all 3 of us. The project lasted about a week, with each of us doing different things and tasks throughout the week until it was finally complete!
